QA and Testing References

- [How Many Bugs Are Left in the Software](#) - from leankit, the simple model is if two people look at the same area of code and person a finds A bugs, person b finds B bugs and there are C bugs in common then using the [Lincoln model](#) an estimate for the total number of bugs in the code is $(A * B) / C$. The thinking here is that the more often you find common bugs the more likely it is that you have found all the bugs.
